ORIG. PUB. : V sb.: Kratkiye itogi nauchno-issled. raboty (Kubansk. ris. opyt. st.) za 1956 g. Krasnodar, "Sov. Kuban'", 1957, 138-14.
 ABSTRACT : The soil and climatic conditions of Saratovskoye Zavolzh'ye permit production of a yield of 30-40 c/ha (1954-1956 trials) with the cultivation of rapidly maturing varieties. The principal methods of agricultural technique for rice in Zavolzh'ye are: irrigation with reduced flooding, thicker plantings, measures directed towards the shortening of the vegetative period. — O. V. Yakushkina

 TITLE : Rice in Saratov Oblast.
 GRID. PUB. : Tr. Saratovsk. s.-kh. in-ta. 1957, 10, 136-150
 ABSTRACT : Climatic and soil conditions of the left shoreline of Volga permit rice growing. A number of varieties with a short vegetative period have been brought out for the cultivation of rice in the oblast'. The varieties recommended, produced grain yields of 20-30 centners/ha. In quality and chemical composition, the grain was not inferior to the varieties grown in the southern regions of Ukrainian SSR. Measures of agricultural technique for rice are cited: sowing dates, seed planting depth, methods of sowing, application of water and the maintenance of the crop.

TITLE: Evaluation of the Stability of Kerosene Type Fuels by Pumping Through Fuel Pumps of Turbojet Engines
(Otsenka stabil'nosti topliva tipa kerosina prokachkoy cherez toplivnyye nasosy turboreaktivnogo dvigatelya)

PERIODICAL: Khimiya i Tekhnologiya Topliv i Masel, 1958, Nr 4, pp 51 - 54 (USSR)

ABSTRACT: A method for the evaluation of the stability of kerosene fuels was developed by VNII NP, by pumping the fuel through a turbo jet engine. Several laboratory methods are known for evaluating the stability of kerosene type fuels; however, these are unsatisfactory because they are carried out under static conditions which differ considerably from the conditions existing in an actual heating system. A scheme of the testing device is given in a diagram on page 53. The samples of the fuel are tested on this device and in a thermostat. 60 litre of fuel are poured into a test apparatus and pumped by circulation in eight stages at a temperature of 50°C; each stage is divided into two half-hour stages with a sufficiently long interval between the half stages to allow the fuel to be cooled to the temperature of the surrounding medium. The

Card 1/3

65-58-4-9/12

Evaluation of the Stability of Kerosene Type Fuels by Pumping Through Fuel Pumps of Turbojet Engines

fuel is changed every eight hours, and the input is 1500 liters during the whole time of the investigation (25 stages). During the intervals between the stages (5 - 7 days) the pumps are kept at a temperature of 40°C in a thermostat. After 50, 100 and 200 hours of the experiment, the pumps are partly dismantled and inspected to determine whether any deposits have formed on the parts of the test apparatus. When pumping kerosene fuel for 50 - 100 hours, tar deposits are formed on the surface of parts of an apparatus made from antimony bronze VB-24, but no changes were observed on parts made from aluminium bronze BrAZhN10-4-4. VNII NP together with VIAM (Ref.1) developed types of bronze of modified composition which showed decreased catalytic action e.g. antimony bronze B8-24N. Comparative tests were carried out with kerosene fuel on pumps made of three types of alloys on a copper basis; aluminium,

Evaluation of the Stability of Kerosene Type Fuels by Pumping
Through Fuel Pumps of Turbojet Engines

antimony and antimony - nickel bronze. Results obtained on these three types of bronze after fifty-hour tests are compared. VNII NP also carried out parallel experiments with various types of anti-oxidants. Satisfactory results were obtained when adding p-oxydiphenylamine. These experiments were carried out over a period of 200 hours (six months). There is 1 Figure, 1 Russian Reference.

TITLE: High temperature corrosion of metals during combustion of distilled gas-turbine fuels

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 3, 1966, 54-57

TOPIC TAGS: corrosion, solid mechanical property, gas turbine fuel, turbine engine

ABSTRACT: The effect of sulfur content (0.3-2.4%) in vacuum distillation residue and diesel oil fuels on corrosion of gas-turbine metal blades was investigated in the 650-850°C range using a laboratory scale combustion unit. The test duration was 100 hrs. The corrosion of steel and alloy blades in a gas stream during combustion of the thermal catalytic cracking distillates is shown in figure 1. It was found in the cases of EI-598 nickel-based and EI-607 alloy steels and high-chromium EI-417 steel that the blade corrosion remains in 0.026-0.066 g/m²·hour limits for a wide range of sulfur content in vacuum residue fuels. For diesel oils the material loss remained within 0.038-0.073 g/m²·hour limits. For fuels containing 2.4% S and 0.007% ash, the in-

blades from 0.001 to 0.002-0.004 g/cm². At 850°C, both the low-sulfur gas turbine fuels and the diesel fuels had blade deposits equal to .0006-0.0026 g/cm². In general, fuels of various origins and FBP up to 480°C can be recommended for use as gas turbine fuels. Orig. art. has: 2 figures, 2 tables.

TITLE: Undercompensation, absolute invariance, and overcompensation in automatic-control systems

SOURCE: Avtomatyka, no. 2, 1964, 16-32

TOPIC TAGS: automatic control, automatic control error undercompensation, automatic control error overcompensation, automatic control invariance, automatic control error burst

ABSTRACT: The stability of a 2-loop differential system without disturbance coupling is claimed to have been proven experimentally in the zero and negative error ranges. Differentiator inaccuracy equally affects both the combined and differential systems, insofar as their invariant-region-alignment stability is concerned. Experiments were staged on a speed-regulator model with not too abrupt disturbance changes and with $n > m$. Two conditions prevent a positive error burst at the start of a transient: a limited acceleration and a higher order of the left-hand member in $\frac{d\lambda}{dt^q} < \left(\frac{v}{\epsilon}\right)_{\epsilon}$ and $0 < q \leq n - m$. With these conditions

Card 1/2

ACCESSION NR: AP4026840

breached, the controlling variable necessary for absolute invariance falls outside the linear part of the characteristic which causes a short burst of positive error. Later on in the process, the occurrence of both positive and zero and even negative dynamic error is possible. This does not hold true for single-loop systems; they cannot be equivalent to negative-error systems and, therefore, the conversion of a multiloop into a single-loop system cannot be justified in this sense. Such a conversion results in a single-loop system with physically unrealizable components (infinite or negative amplification, etc.); this explains the incorrect view that the stable operation of a differential system without disturbance coupling is impossible under absolute-invariance and error-overcompensation conditions. ... of industrial waste waters ... and their
... biochemical method

... biochemical method ...

... information is presented on the ...

... information is presented on the ... and
... of the sewer waters of the ...
... and their biochemical purification. The ...
... were found to be characterized by the presence of petroleum
... products, volatile and nonvolatile phenols, benzene, fatty
... and sulfur compounds. In spite of the complex and varied
... of the organic contaminants contained in the ...
... their biochemical purification was found to be quite possible.

... that can be used in the planning of ...
installations. The average oxidative capacity of two-stage aeration installa-
... on total purification should be taken to be ... at a concen-

L 10928-65

active sludge of 4 g/liter with respect to dry matter. Effective
of the aeration installations required the delivery of 50 cubic
air per kilogram of reduced biochemical oxygen consumption, at a
the aeration tanks of 4 meters. The duration of the aeration period
also depend on the degree of contamination and temperature of the
purified. For sewer waters analogous to those investigated, an
period of 18-24 hours, including 6-8 hours for the first stage and
for the second, is recommended. The temperature of the sewer
water in the range of 20-28°C. (112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, COUNTRY : USSR
 CATEGORY : Pharmacology, Toxicology. Local Anesthetics ✓

ASS. JOUR. : RZBiol., No. 12 1958, No. 56695

AUTHOR : Andreyeva, A.G., Komarov, F.I., Timeskov, I.S.
 INST. : Leningrad Sanitation-Hygiene Medical Institute
 TITLE : The Problem of the Treatment of Ulcer Patients with Novocaine.

ORIG. PUB. : Tr. Leningr. San.-Gigiyen. Med. In-ta, 1957, Vol. 31, 87-97

ABSTRACT : Visceral anesthesia by the method of N.I. Leporskiy was carried out in 915 patients. In 80.6% of the patients, pain disappeared (within 1-2 days), in 10.6% it diminished. There was simultaneous improvement in appetite and sleep, a reduction or disappearance of dyspeptic manifestations. Control X-ray studies (over a 2-year period) demonstrated in 56% of the patients an absence of the niche with good general well-being and freedom from symptoms. -- A.Yu. Stychko-Megrin

<p>CP</p> <p>DELIGNIFICATION OF WOOD WITH GASEOUS CHLORINE. F. Komaryk, <i>Bumashkaya Prom.</i> 12, No. 5, 9-24(1963). Lab. expts. in the sepn. of cellulose by delignification of wood with gaseous Cl led to the following conclusions: The degree of delignification depends to a certain extent on the quantity of Cl used. A complete delignification can be accomplished only by intermittent chlorination and removal of chlorinated lignin by washing. The resinous matter retards the chlorination very little, and is removed together with chlorinated lignin by washing with alkalis. Chlorination of detersified samples showed no advantage. The effect of wood swelling on chlorination varies with different kinds of trees. The yield of cellulose is decreased by delignification of wood previously treated with aq. NaOH at 90°, and is practically unaffected by such a treatment with sulfite. Aspen, poplar, willow (66% yield of cellulose) and spruce (60%) are more easily and completely delignified. Birch, beech and especially pine are less easily delignified. In the delignification, 11-13.6% of other constituents of wood, mostly carbohydrates (pentosans), is removed from leafy trees and 5.5-7% from conifers. Thirteen references. Chas. IN
Chemical composition of wood damaged by wood-destructive rots. *F. Kozakova, Sumshaya Prem. 13, No. 2, 49-60(1934).*—The exper. study of the chem. properties of wood affected by rot and their use in pulping and hydrolysis was made with 16 different samples of pine, spruce, aspen and birch living trees and some structural timber. Identical sections were prepd. from sound and rotting trees, growing under exactly similar conditions and being of the same age and trunk height and diam. The extractable matter was detd. with hot H_2O , H_2O and 1% NaOH at 18°, and lignin, pentosans, cellulose and ash were detd. in the extd. samples. A study was made of the hydrolysis with 0.5 and 72% H_2SO_4 and of the absorption of H_2O by sawdusts. Conclusions: In all cases, except 1 with aspen, the hygroscopicity of sawdusts of rot-damaged woods was 1-1.5% lower than that of normal trees; thus the phys. structure of rotted trees does not affect the analytical data (this was substantiated by the results of hydrolysis). The wood of living trees in the 2nd and 3rd stages of corrosive rot or white rot (Palk and Hlad, C. A. 21, 1137) by *Trametes pini* (pine) and

Trametes abietis (spruce) are little changed from normal wood in the relative contents of cellulose and pentosans (decrease of 1-1.5% cellulose in spruce), and can be used for pulping and hydrolysis. Pine damaged by *Polyporus destructor* (white rot) contains relatively even more cellulose than a normal tree (68 instead of 62%) and less lignin. Pine and spruce affected by the destructive rot or brown rot (Palk, loc. cit.) of *Merulius lacrymans* (prevaleat in building timber) (pine) and *Fomes pinicola* (spruce) shows a sharply decreased content of cellulose and pentosans and increased lignin. Birch damaged by white rot possesses highly complex chem. compn. and is unsuited for practical uses. *Fomes igniarius* and the fungus *Polyporus betulinus* decompose cellulose in birch. The chem. compn. of aspen damaged by *Fomes igniarius* differs very little from that of normal wood; it can be seen from the lowered sp. gr. that the chem. changes affected uniformly all component parts of the wood. The yields of reducing sugars of the sound and rotting trees obtained by hydrolysis are the same, and are even higher with pine damaged by *Polyporus destructor*. The work is being continued. Chas. Blanc

Bleaching of viscose pulp in the Gyaskil combine. N. I. Nishin, P. Komarov and I. A. Nagrodskii. *Priroda*, 1958, No. 4, 31-41 (1958). —A crit. discussion of the lab. control and operation of the bleaching process of viscose pulp, with various suggestions for improvements. In the 2-stage process, the best results were obtained with the lower bleaching at 17-20° and 18-20% $\text{Ca}(\text{ClO})_2$. Viscose pulp of satisfactory chem. and phys. properties was obtained from pulp with a viscosity of 200-50 millipoises, contg. 1.7-2.2% lignin (hardness 17-23). The concn. of bleaching liquor should be detd. not by gravity but by titration, and should be fed into the rolls in 2 stages with the intermediate detn. of the bleaching stage.

Bleaching of (sulfite) pulp with sodium hypochlorite.
 V. Komarov and I. Nagrodskii. *Memashkova* from 19.
 No. 4. 42-8(1030). — The results of expts. in bleaching
 sulfite pulp by 1 stage with NaClO , and by 2 stages with
 NaClO and with $\text{NaClO} + \text{Ca}(\text{ClO})_2$ are tabulated and
 discussed. The results were checked by parallel bleaching
 with $\text{Ca}(\text{ClO})_2$ alone. One-stage bleaching with NaClO
 gave unsatisfactory results. The 2-stage process with
 NaClO gave a good product in respect to viscosity and
 lignin, α -cellulose and ash contents. Substituting Ca -
 ClO_2 for NaClO in the 1st stage gave somewhat inferior
 pulp, but a better one than is obtained by 1-stage bleach-
 ing with NaClO . Chas. Blane

PROCESSES AND PROPERTIES INDEX																																																			
<p>Chemical processes occurring in the microbiological decomposition of wood. I. E. Kuznetsov and G. P. Ponomareva. <i>J. Applied Chem. U.S.S.R.</i> 10:1487-93 (in French) 1961(1967). Decomposition of pine by <i>Merulius lacrymans</i> or <i>Polyporus destruens</i> and of birch by <i>Fomes igniarius</i> under natural conditions, caused a variation in the content of the OMe group, depending on the lignin content and the species of the fungus. Scarcely any changes were observed in the relative contents of Ac group and the uronic acid, but because of a decrease in the sp. gr. of the woody matter it was concluded that a considerable amt. of the Ac groups and uronic acids was lost, probably as a result of pentosan decomposition. The reducing power of woody matter is increased by the action of the fungus. Aq. exts. of the altered wood contained considerable amts. of tanning substances (22-45% of the substances sol. in hot water), reducing substances (1.7-20.2%, part of which are probably combined with the tanning substances, and inorg. substances 4.80-10.01% (by wt.) of the substances sol. in hot water. The water-sol. substances contained 47.70-50.85% C, the C content of the wood. The alk.-C₁₈H₁₇ sol. substances obtained in the decomposition of wood contain less free monomeric tar acid (acid no. 125-117) than, e.g., rosin (acid no. 140-180). The substances extd. with 1% alkali contain furfurals in amts., depending on the wood and species of fungus, and carbohydrates which yield on hydrolysis 8.50-22.38% (by wt. of the alkali-sol. substances) of reducing sugars, depending on the species of fungus. evaluation of the quality of viscose pulp from the transparency of its solutions. P. Komariv and I. A. Nagroskikh. *Russkaya Pulp*, 18, No. 7, 1970 (1970).

The tentative scheme for the determination of the quality of viscose pulp is based on measuring the transparency (turbidity) of 1% viscose sols. in a monochromatic light of definite wave length with the aid of the Konig-Martens spectrophotometer. Tests with filtered and unfiltered viscose solns., derived from different grades of bleached, unbleached and refined sulfite pulp, showed that the coeff. of absorption depends on the quality of pulp used in the production of viscose. It appears that the transparency of viscose solns. is influenced not only by the final impurities, but also by the purity of chem. agents (NaOH) and water. The relative transparency of solns. improves with repeated filtrations, but never becomes complete. The effect of various admixts. (lignin, resins, ash, pentosans), the contents of α -cellulose, whiteness and other factors on the transparency of viscose solns. is being investigated. Cf. Zakoschukov and Tumarkin (C. A. 31, 24149).

PROCESSIES AND PROPERTIES INDEX																									
<p>CA</p> <p>Preparation of soft sulfite pulp in light colored liquor. <i>P. P. Kuznetsov, Khimicheskaya Prom. 20, No. 1, 2, 22 (1945).</i> The production of soft pulp by the sulfite method is discussed. The observations were made on 2 cooking units of which one (280 cu. m. capacity) was operated with a Se-contg. SO₂ gas which was cleaned and washed before it was delivered to the acid towers, and the other (90 cu. m. capacity) used a SO₂ gas obtained from Se-free S. Completion of the pulping in a light-colored cooking liquid produces a soft and thoroughly cooked pulp, whereas completion in a dark (brown) liquid usually gives a hard and not thoroughly cooked product. Both these conditions depend on the nature of the H₂SO₄ used in the process. The quality of the acid in turn is affected (adversely) by the use of blow-down liquid from the digester in its production. Particularly detrimental are the thiosulfates in the blow-down liquid. Avoiding the use of the blow-down in the regeneration process insures good results in the cooking operation. The blow-down from the last stages of pulping is most harmful. M. Hosen</p>
